About the cover: Death Valley, one of the hottest places on Earth and home to more than 1000 species of plants, including more than 50 endemics, received record amounts of rain during the winters of 2004 and 2005. Through March of 2005, more than 8 inches of rain fell—4 times the yearly average of only 1.96 inches. Dormant seeds of various desert flowers germinated and flourished at record levels. This photograph was taken during one of these record rainfalls in March 2005.

“One of the strengths of Masters/Ela is that the text is easily readable by undergraduate students who do not already have much background in environmental engineering and science. The writing style is clear and engaging.”

• Bruce E. Rittman, Arizona State University

“This is one of the clearest and best written textbooks I have used. The text is concise and informative with a minimum of technological jargon. I know that I could not be as effective an educator without well written and thoughtful textbooks such as Introduction to Environmental Engineering and Science.”

• Gail Montgomery Brion, University of Kentucky

“The best features of this text are its readability and clarity. Secondly, its use of the mass balance approach, and carrying it throughout the rest of the book, is a great strength as

well. — Gregory G. Wilbur, Oklahoma State University

Got for a class

very good

Purchased book at used - good quality. Received book and I would say it is fair to poor quality. The binding is falling apart and it has a ton of markings inside. The shape it is in does not reflect the price paid to own it.

The exercises are very well explained and the book follows a logical order in the chapters explained. The exercises and samples in metric values are very helpful for European students and professors.

The delivery was so fast. It is relatively nice as a used book. This is a paperback US edition, although it looks like the international one. (the international edition has some different end chapter exercises, which is a big problem if you use it as your textbook in class). Anyway this book does not have that problem, and considering its price and the customer service, I totally recommend it if you are taking this course!

I'm not an environmental major at all, but this book describes the topics in a way that makes sense. It brings up topics I never thought would be covered in environmental, like human populations in developed and undeveloped countries and stuff like that, which does make sense.

After graduated, I still enjoy reading this book for references. I also used it for my masters degree.

Just what we needed at a great price
